Difference**

Farm Grown Feed Factsheet

Why farm grown feed?

In New Zealand we have a reputation for being pure, natural and efficient producers of nutrition.

Our pasture-based farming system and use of farm grown feeds supports this reputation and in turn protects the value we generate today and into the future.

Farm grown feed sits at the heart of our low cost, low carbon footprint model of production. It's attributed to lower water use and improved levels of soil organic matter.

What is the definition of Farm Grown Feed?

Farm Grown Feed as defined for the purposes of The Co-operative Difference is:

Any pasture, forage or fodder crop that is grown in NZ for the purpose of feeding to stock.

The definition explicitly excludes feed such as:

- Process by-products and concentrates
- Fruit and Vegetables
- Grains and Cereals
